LATEST PROJECT HIGHLIGHTS

Vågå: Strong Copper Results

Exploration at Tesskrokan has uncovered high copper grades up to 3.03% Cu over a 1.5km area, indicating significant exploration potential in the region.

Tysklandsgruve: Massive Sulphide Potential

Recent findings from waste rock samples from Tysklandsgruve prove potential for massive sulphide mineralisation with grades of up to 1.86% Cu, 1.87% Ni, 0.10% Co, 0.43 ppm Au and 0.21 ppm Pd, aligning with electromagnetic conductor targets already identified.

Skaug: Ertelien-style footwall vein mineralisation confirmed

Ertelien-style footwall vein mineralisation confirmed at Skaug, with samples grading up to 4.72% Cu, 1.64% Ni, 0.16% Co and 0.56 ppm Au.

Jolinatten: Promising Nickel-Copper-PGEs

Rock samples from Jolinatten have revealed high nickel-copper-PGE tenors, supported by soil sampling results that point to broad, unconstrained, high-potential exploration areas.
